2.8.5
Release notes
for Android
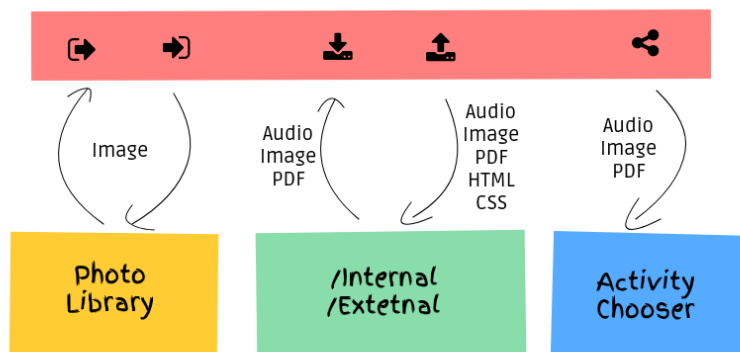

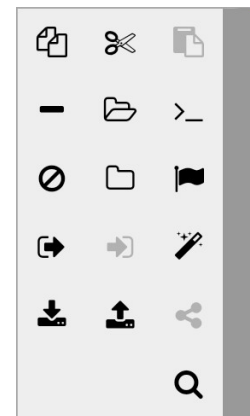

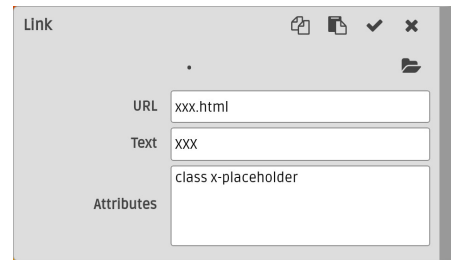

V 2.8.5

👉 This version increased the **computation required for password encryption and decryption**. If you have a low end device, you may notice a little bit more delay in login and backup/restore of keys. Backups created by any previous versions of the app are not affected and should continue to work as before. However, as a general rule, backups created by a particular version should only be used in the same or later version.

👉 There is a new **Share action (⤳)** in the Files Panel that export the selected media file (audio, image, PDF), through the Activity Chooser, to an external viewer. Furthermore, the Export action can now export HTML and CSS files. The Import/Export actions now works on both the Internal and External backup directories.
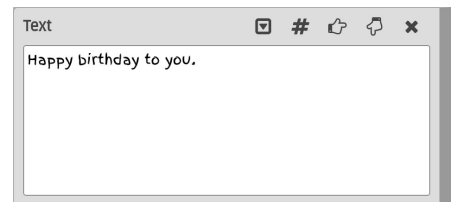

👉 Click on a link in editing mode now opens the Edit Link dialog automatically, making it **much easier to edit links** in the document.

👉 There is a new **Delete Empty Directories action** (🗁) in the Files Panel that delete recursively all empty directories under the current directory. That may comes in handy when a lot of empty directories left behind after you move files.

👉 Insert/Edit text dialog now use the **same font-family** as in the document, so it looks very much like how it looks in the document.

👉 The search action at the Files Panel now perform simply substring search on filename, ignorecased instead a wildcard search on the filepath, which is easier to use.

👉 You can now **edit CSS stylesheets** while document is in browsing mode.

🐞 Other minor updates and bugs fixes.
